Dell Pro Max with GB10 — Product Overview

The Dell Pro Max with GB10 is a compact desktop AI supercomputer built around the NVIDIA GB10 Grace Blackwell Superchip. It brings data-center-class AI capability to a desk-side form factor, letting teams prototype, fine-tune, and run inference on large AI models locally — without sending data to the cloud.

Superchip architecture

The NVIDIA GB10 Grace Blackwell Superchip combines an NVIDIA Blackwell-generation GPU with a 20-core Arm CPU (10 Cortex-X925 performance cores and 10 Cortex-A725 efficiency cores) connected via NVLink-C2C chip-to-chip interconnect. This delivers up to 1 petaFLOP of AI performance at FP4 precision.

Unified memory

The system features 128 GB of unified LPDDR5x memory shared coherently between the CPU and GPU. Unlike traditional PCs where GPU memory is a separate, small pool, the GB10's unified architecture lets AI models up to roughly 200 billion parameters fit in memory on a single device. Two units can be connected to work with models up to about 405 billion parameters.

Storage and connectivity

The Dell Pro Max with GB10 ships with up to 4 TB of NVMe SSD storage. Connectivity includes NVIDIA ConnectX-7 SmartNIC networking for clustering two units, Wi-Fi 7, 10 GbE, and USB4 ports. The system runs NVIDIA DGX OS, an Ubuntu Linux–based operating system with the full NVIDIA AI software stack preinstalled.

AI software stack

The device supports the complete NVIDIA AI platform, including CUDA 13, TensorRT-LLM, NeMo, RAPIDS, and popular open-source frameworks such as PyTorch, Ollama, vLLM, and llama.cpp. NVIDIA publishes step-by-step playbooks covering inference, fine-tuning, image generation, data science, and multi-agent applications.

Why local AI matters

Running AI workloads locally keeps sensitive data on-premises, eliminates per-token cloud API costs, and provides consistent performance without network latency. For regulated industries — healthcare, legal, finance, government — local AI enables the use of large language models on confidential data that cannot leave the organization.

Power and form factor

The system draws approximately 240 watts under full load — comparable to a gaming laptop — and fits in a 150 mm × 150 mm × 50.5 mm chassis. It plugs into a standard wall outlet, requires no special cooling, and operates quietly enough for an office or conference room.
